PREFACE

The Endocrinology Index is a bimonthly publication of the National Institute of Arthritis and Metabolic Diseases. This selected bibliography which is produced from the National Library of Medicine's Medical Literature Analysis and Retrieval System (MEDLARS), has been initiated to supply those scientists working in the field of endocrinology with a much needed current awareness tool and is intended to help facilitate greater integration of research and clinical efforts in this field.

The National Institute of Arthritis and Metabolic Diseases is able to make available to qualified investigators in the field of endocrinology a limited number of free copies. Requests from qualified individuals to receive free copies of this publication, address changes, and other communications should be addressed to:

Acknowledgment

The Endocrinology Index was compiled with the cooperation and assistance of the staff of the National Library of Medicine. The citations were processed by the Library's computer-based Medical Literature Analysis and Retrieval System (MEDLARS) and were printed from film composed by Graphic Arts Composing Equipment (GRACE), MEDLARS' high-speed phototypesetter.

EXPLANATION OF FORMAT

The period covered by this issue of the bibliography corresponds to the same months of Index Medicus. The journal coverage is limited to journals covered by Index Medicus, but the Endocrinology Index contains additional subject headings that are not included in Index Medicus. This Endocrinology Index is arranged in seven sections: 1) Table of Contents; 2) Subject Section; 3) Review Section; 4) Method Section; 5) Author Section; 6) Subject Index; and 7) Author Index.

Subject Section

This section is for the reader interested in recent literature related to certain broad topics. The subject section is divided into eight categories (pituitary, thyroid, etc.). The endocrine pancreas has not been included since it is the subject of another recurring bibliography, Diabetes Literature Index. Each category has a preconceived hierarchical organization of subject headings. A particular citation may appear more than once if it deals with multiple topics. Each citation to an article contains the full title, first author, and journal reference. If the article is written in a foreign language, the language is indicated. If the citation is to a review article, the number of references is given.

Author Section

This section provides the reader with a list of keywords or index terms assigned to each citation. In this section each article appears only once. The citations are arranged alphabetically according to first author and are numbered consecutively. These numbers are then used in the Author and Subject Indexes to enable the reader to identify references with ease. The complete citations (including index terms) are found in this section, but only the first three authors are listed. Foreign titles appear in the original language; these titles have been translated into English in the Subject Section. Following each citation are index terms which have been assigned to describe the contents of the article. Index terms appear in capital letters; some of these are accompanied by subheadings which appear in lower case letters; asterisks (*) identify the index terms under which articles appear in Index Medicus.

Subject Index

All of the index terms assigned to the citations appearing in the bibliography are listed, followed by citation numbers which correspond to the numbers in the Author Section. This section is included for the convenience of the reader who wishes to select articles falling in categories of his own conception. For example, one who is interested in protein binding of a particular hormone could quickly find whether there were any articles dealing with this subject by seeing whether there were any citation numbers common to the two headings "protein binding" and the name of the specific hormone.

Author Index

The names of all authors are listed, followed by citation numbers which correspond to the numbers in the Author Section.

NATIONAL LIBRARY OF MEDICINE LITERATURE SEARCHES

Literature searches are bibliographies on specific biomedical subjects periodically published by the National Library of Medicine, National Institutes of Health. Originally prepared by the Library's computer-based MEDLARS (Medical Literature Analysis and Retrieval System) in response to requests from physicians, researchers, and educators, these bibliographies are reprinted and made available to interested health professionals on request. They consist of references to articles from the world's biomedical journal literature.

An up-to-date listing of all literature searches as well as single copies of the literature searches may be requested from the Office of Public Information, National Library of Medicine, 8600 Rockville Pike, Bethesda, Maryland 20014.

CLASSIFICATION OF THYROID DISEASE

The following classification of thyroid disease consists of thyroid nomenclature accepted by the American Thyroid Association and developed by a committee of the Association, Dr. Sidney C. Werner, Chairman; and the corresponding medical subject headings (MeSH) used in the Endocrinology Index.

The MeSH terms appear in capital letters, and appropriate subheadings follow in small letters, separated by a transverse bar. If more than one MeSH term is applicable, the terms are separated by the word "or". For example, I. H. Congenital anomaly would appear under THYROID GLAND/ abnormalities (or) STRUMA OVARII depending on the content of the article. If it is necessary to use two or more terms to cover a concept, the terms are separated by the word "and". For example, I. A. 2. b. Iodine excess would appear under GOITER (and) IODINE/adverse effects.

It is hoped that this will be useful to the user of the Endocrinology Index as well as to the indexers at the National Library of Medicine. We are grateful to Dr. Werner for making the nomenclature available to us.
